

IGGESUND TOOLS

THE CUTTING EDGE OF CHIPPING AND DEBARKING TECHNOLOGY

TURNKNIFE SYSTEM II

FOR INCREASED PROFITABILITY

Resetting of knives use to be a heavy job usually for two people. That is not the case any more. Switch to Iggesund Tools TurnKnife® System II (TKII) and this job can easily be done by one person operating on the front side of the chipper

handling lighter parts and using simpler tools. In comparison, edge to edge the running time of the TurnKnife is superior to any old style knife. The TurnKnife last 2-3 times longer, with increased chipping capacity as a result.

In other words everything is going to be better for you:

- Easier handling
 - Less personnel required
- Increased running time
 - More capacity
- No regrinding
 - Lower costs
- Improved precision
 - Better chip quality
- No babbitting
 - Improved safety

TURNKNIFE SYSTEM II

- The profitable alternative

If your chipper is designed for heavy wear segments on the disc, Iggesund Tools adjustable wear segments is the way to go!

The way our wear segments are designed, split into two basic components; the disc plate and the wear plate, it will make your handling procedure a lot more comfortable and your maintenance easier and less costly. It will also increase the precision in your chipper. The chip length can easily be modified by swapping the light and easily replaceable wear plate. The same simple procedure is used when you have to replace worn out wear plates. The wear plate comes either in a plain plate hardened by heat treatment or with a long-lasting hard coated surface.
